ENGLISH

IMPORTANT INFORMATION ON THE SECURE®-C CERVICAL ARTIFICIAL DISC

CAUTION: Federal (U.S.A.) Law Restricts this Device to Sale by or on the order of a Physician

How Supplied

Implant Components – Sterile
Surgical instruments – Non-Sterile (unless otherwise noted on the package label)

DESCRIPTION

The SECURE®-C Cervical Artificial Disc (SECURE®-C) is an articulating intervertebral device comprised of two endplates and a central core, and is inserted using an anterior cervical approach. The superior and inferior cobalt-chrome alloy (CoCrMo per ISO 5832-12, ASTM F1537) endplates feature multiple serrated keels and a commercially pure titanium plasma spray coating (per ISO 5832-2, ASTM F1580, F1978, F1147, and C-633) on the bone contacting surfaces. The sliding core is composed of ultra-high molecular weight polyethylene (UHMWPE per ISO 5834-2, ASTM F648), with a spherical superior interface and a cylindrical inferior interface articulating with the endplates.

SECURE®-C implants are offered in a variety of configurations to accommodate varied patient anatomy. Implant footprints are as follows (AP depth x ML width): 11x12mm, 13x14mm, 14x16mm and 15x18mm. SECURE®-C provides 0° or 6° lordosis options in its neutral position. Implant heights range from 6mm to 12mm, in 1mm increments. A list of SECURE®-C implants is provided in **Table 1**.

The SECURE®-C Cervical Artificial Disc is designed to allow motion in flexion and extension up to 30° (±15°), and in lateral bending to 20° (±10°). The design is intended to also allow unlimited axial rotation, and is constrained by ligaments and posterior elements. The device is also designed to permit translation of ±1.25mm in the sagittal plane.

Table 1. SECURE®-C Cervical Artificial Disc Implants

414.311S	SECURE®-C Core, 14x16, 11mm	714.476S	SECURE®-C Endplate and Core Assembly, 15x18, 6mm, 0°

SECURE®-C devices are implanted using instruments specific to the device, as well as manual surgical instruments. Instruments specifically designed for implanting SECURE®-C consist of trials, milling guides, broaching chisels, keel chisels, chisel endcap, implant holding block, implant holders, and endplate positioners. Manual surgical instruments include instruments for cervical distraction, discectomy preparation, and milling.

INDICATIONS FOR USE

The SECURE®-C Cervical Artificial Disc is indicated in skeletally mature patients for reconstruction of the disc at one level from C3-C7 following single-level discectomy for intractable radiculopathy (arm pain and/or a neurological deficit) with or without neck pain, or myelopathy due to a single-level abnormality localized to the disc space and at least one of the following conditions confirmed by radiographic imaging (CT, MRI, X-rays): herniated nucleus pulposus, spondylosis (defined by the presence of osteophytes), and/or visible loss of disc height as compared to adjacent levels. The SECURE®-C Cervical Artificial Disc is implanted using an anterior approach. Patients should have failed at least 6 weeks of conservative treatment prior to implantation of the SECURE®-C Cervical Artificial Disc.

CONTRAINDICATIONS

The SECURE®-C Cervical Artificial Disc should not be implanted in patients with the following conditions:

- Active systemic infection or localized infection at the surgical site
- Osteoporosis or osteopenia defined as a DEXA bone mineral density T-score ≤ -1
- Allergy or sensitivity to cobalt, chromium, molybdenum, titanium or polyethylene
- Marked cervical instability on neutral resting lateral or flexion/extension radiographs; translation >3mm and/or >11° rotational difference from that of either adjacent level
- Severe spondylosis at the level to be treated, characterized by bridging osteophytes, loss of disc height >50%, an absence of motion (<2°) as this may lead to a limited range of motion and may encourage bone formation (e.g. heterotopic ossification, fusion)
- Severe facet joint arthropathy
- Significant cervical anatomical deformity or clinically compromised vertebral bodies at the affected level due to current or past trauma (e.g., by radiographic appearance of fracture callus, malunion or nonunion) or disease (e.g., ankylosing spondylitis, rheumatoid arthritis)
- Symptoms attributed to more than one vertebral level

WARNINGS

The SECURE®-C Cervical Artificial Disc should only be used by surgeons who are experienced with anterior cervical spinal procedures and have undergone hands-on training in the use of this device. Only surgeons who are familiar with the implant components, instruments, procedure, clinical applications, biomechanics, adverse events, and risks associated with the SECURE®-C Cervical Artificial Disc should use this device. A lack of adequate experience and/or training may lead to a higher incidence of adverse events, including neurological complications.

Correct selection of the appropriate implant size and correct placement of the device are essential to ensure optimal performance and function of the device. Please refer to the SECURE®-C Cervical Artificial Disc Surgical Technique manual for step-by-step instructions on the required surgical technique, including determining the correct implant size.

Due to the proximity of vascular and neurological structures to the implantation site, there are risks of serious or fatal hemorrhage and risks of neurological damage with the use of this device. Care should be taken to identify and protect these structures during surgery.

Heterotopic Ossification (HO) is a potential complication associated with cervical total disc replacement devices, which could result in reduced motion. It is recommended that bone wax is used following removal of osteophytes during surgery, to possibly reduce HO bone formation. The short-term postoperative use of non-steroidal anti-inflammatory drugs (NSAIDs), is recommended to possibly reduce the chance of developing HO.

Anterior or posterior expulsion/migration of the SECURE®-C core or endplates have been reported in patients outside of the clinical study (<0.5%). These events have occurred in patients with instability, poor implant placement or sizing, or postoperative trauma. Proper patient selection, surgical technique and implant sizing should be used to help prevent expulsion/migration.

PRECAUTIONS

The safety and effectiveness of this device has not been established in patients with the following conditions:

- Intractable radiculopathy or myelopathy due to pathology at more than one level and/or pathology not localized to the disc space;
- Skeletally immature patients, pediatric or adolescent children (<21 years old), or those over the age of 60;
- Prior fusion at an adjacent vertebral level;
- Prior surgery at the level to be treated;
- Progressive symptoms and signs of spinal cord/nerve root compression with less than six weeks of conservative treatment;
- Facet joint disease or degeneration at the involved level;
- Neck or arm pain of unknown etiology;
- Neck pain alone;
- Paget's disease, osteomalacia, or other metabolic bone disease;
- Rheumatoid arthritis or other autoimmune disease;
- Neuromuscular disorders such as muscular dystrophy, spinal muscular atrophy, amyotrophic lateral sclerosis;
- Severe insulin dependent diabetes;
- Systemic disease including AIDS, HIV, and Hepatitis;
- Taking medications known to potentially interfere with bone/soft tissue healing (e.g., steroids);
- Active malignancy (including spinal metastases);
- Acute mental illness or substance abuse; and
- Pregnancy.

Pre-operative

Patient selection is extremely important. In selecting patients for a cervical total disc replacement, the following factors can be of extreme importance to the success of the procedure: the patient's occupation or activity level; a condition of senility, mental illness, alcoholism or drug abuse; and certain degenerative diseases (e.g., degenerative scoliosis or ankylosing spondylitis) that may be so advanced at the time of implantation that the expected useful life of the device is substantially decreased.

In order to minimize the risk of periprosthetic vertebral fractures, surgeons must consider all co-morbidities, past and present medications, previous treatments, etc. A screening questionnaire for osteopenia or osteoporosis, SCORE (Simple Calculated Osteoporosis Risk Estimation), may be used to screen patients to determine if a DEXA bone mineral density measurement is necessary. If DEXA is performed, the patient should be excluded from receiving the device if the DEXA bone density measured T score is < -1.0, as the patient may be osteoporotic or osteopenic.

The patient should be informed of the potential adverse effects (risks/complications) contained in this insert (see POTENTIAL ADVERSE EFFECTS OF THE DEVICE ON HEALTH).

Preoperative planning may be used to estimate the required implant size, and to assure that the appropriate range of sizes is available for surgery. The procedure should not take place if the appropriate range of sizes will not be available.

Examine all instruments prior to surgery for wear or damage. Instruments which have been used excessively may be more likely to break. Replace any worn or damaged instruments.

Intra-operative

The SECURE®-C Cervical Artificial Disc implant should not be used with components or instruments of spinal systems from other manufacturers. Refer to the SECURE®-C surgical technique manual for step-by-step instructions.

Use aseptic technique when removing the SECURE®-C Cervical Artificial Disc implants from the innermost packaging. Carefully inspect each component and its packaging for any signs of damage, including damage to the sterile barrier. Do not use SECURE®-C implants if the packaging is damaged or the implant shows signs of damage.

Use care when handling the SECURE®-C Cervical Artificial Disc implant to ensure that it does not come in contact with objects that could damage the implant. Exercise care to ensure that implantation instruments do not contact the highly polished articulating surfaces of the endplates. Damaged implants are no longer functionally reliable.

To help prevent expulsion or migration of the SECURE®-C core or endplates, ensure that the SECURE®-C device is properly placed and correctly sized to fit the patient's anatomy.

To prevent unnecessary damage to the bearing surfaces, ensure that tissue or other debris is not trapped within the device.

Surgical implants must never be re-used or re-implanted. Even though the device appears undamaged, it may have small defects and internal stress patterns that may lead to early breakage.

When preparing the disc space, remove anterior or posterior osteophytes as needed, taking care to minimize bone removal. Avoid excessive bone removal as this may weaken the vertebral endplates or vertebral body. Correct positioning of the trial is critical prior to performing chisel cuts. Care should be taken to correctly position the trial during this step. Ensure proper alignment and placement of device components as misalignment may cause excessive wear and/or early failure of the device. Bone wax should be placed into any exposed bleeding bone.

Post-operative

Patients should be instructed in postoperative care procedures and should be advised of the importance of adhering to these procedures for successful treatment with the device. Patients are recommended to wear a cervical collar for a few weeks following surgery, follow a therapy program for active range of motion exercises, and to avoid lifting above the shoulders, heavy lifting, repetitive bending and prolonged or strenuous activities. The time period of these recommendations is managed by the treating physician, taking into consideration the individual patient's condition as well as the stability and functioning of the implant. A two week postoperative course of non-steroidal anti-inflammatories (NSAIDs) is recommended to potentially reduce the incidence of heterotopic ossification (HO).

MRI Safety Information

MR

Non-clinical testing has demonstrated that the SECURE®-C implant is MR Conditional. A patient with this device can be safely scanned in an MR system meeting the following conditions:

- Static magnetic field of 1.5Tesla or 3Tesla only
- Maximum spatial gradient magnetic field of 4,000 gauss/cm (40T/m) or less
- Maximum MR system reported, whole body averaged specific absorption rate (SAR) of 2W/kg (Normal Operating Mode)

Under the scan conditions defined above, the SECURE®-C implant is expected to produce a maximum temperature rise of 1.4°C after 15 minutes of continuous scanning.

In non-clinical testing, the image artifact caused by the device extends approximately 20mm from the device when imaged with a gradient echo pulse sequence and a 3Tesla MRI system.

POTENTIAL ADVERSE EFFECTS OF THE DEVICE ON HEALTH

The potential adverse effects (risks/complications) associated with the use of the SECURE®-C Cervical Artificial Disc include: (1) those associated with any surgical procedure; (2) those associated with anterior cervical spine surgery; and (3) those associated with a cervical artificial disc device, including the SECURE®-C Cervical Artificial Disc. However, the cause of these adverse events is not exclusive to these categories. In addition to these risks, listed below, there is also the risk that surgery may not be effective in relieving symptoms, or may cause worsening of symptoms. Additional surgery may be required to correct some of the adverse effects.

1. Risks associated with any surgical procedure include: abscess; cellulitis; wound dehiscence; wound, local, and/or systemic infection; wound necrosis; edema; hematoma; heart and vascular complications; hypertension; thrombosis; ischemia; embolism; thromboembolism; hemorrhage; thrombophlebitis; adverse reactions to anesthesia; pulmonary complications; organ, nerve or muscular damage; gastrointestinal or genitourinary compromise; seizure, convulsion, or changes to mental status; complications of pregnancy including miscarriage and fetal birth defects; inability to resume activities of daily living; and death.
2. Risks associated with anterior cervical spine surgery include: dysphagia; dysphasia; dysphonia; hoarseness; vocal cord paralysis; laryngeal palsy; sore throat; recurring aspirations; nerve deficits or damage; tracheal, esophageal, or pharyngeal perforation; airway obstruction; external chylorrhea; warmth or tingling in the extremities; deficit or damage to the spinal cord, nerve roots, or nerves possibly resulting in paralysis or pain; dural tears or leaking; cerebrospinal fistula; discitis, arachnoiditis, and other types of inflammation; loss of disc height; loss of proper curvature, correction, height or reduction of the spine; vertebral slipping; scarring, herniation or degeneration of adjacent discs; surrounding soft tissue damage, spinal stenosis; spondylolysis; otitis media; fistula; vascular damage and/or rupture; and headache.
3. Risks associated with a cervical artificial disc device, including the SECURE®-C Cervical Artificial Disc, include: early or late loosening of the components; disassembly; bending or breakage of any or all of the components; implant migration; implant malpositioning; loss of purchase; sizing issues with components; anatomical or technical difficulties; implant fracture; bone fracture; skin penetration, irritation, pain, and/or bursitis resulting from pressure on the skin from component parts in patients with inadequate tissue coverage over the implant; foreign body reaction to the implant including possible tumor formation, autoimmune disease, metallosis, and/or scarring; possible tissue reaction; bone resorption; bone formation (including heterotopic ossification) that may reduce spinal motion or result in a fusion, either at the treated level or at adjacent levels; development of new radiculopathy, myelopathy, or pain; tissue or nerve damage caused by improper positioning or placement of implants or instruments; bending or breakage of a surgical instrument, as well as the possibility of a fragment of a broken instrument remaining in the patient; loss of neurological function; decreased strength of extremities; decreased reflexes; cord or nerve root injury; loss of bowel and/or bladder control or other types of urological system compromise; and interference with radiographic imaging because of the presence of the implant.

For the specific adverse events that occurred in the clinical study of the SECURE®-C Cervical Artificial Disc, please see the Safety Results in the CLINICAL STUDY section below. Some of the most common adverse events experienced by study patients were: neck and/or arm pain, dysesthesia, back and/or leg pain, musculoskeletal events (excluding spinal events), and difficulty swallowing.

CLINICAL STUDY

The clinical investigation of the SECURE®-C Cervical Artificial Disc was conducted under an approved IDE (G050075). The study was a prospective, multi-center, two-arm, randomized, unmasked, concurrently controlled, non-inferiority trial to assess the safety and effectiveness of the SECURE®-C Cervical Artificial Disc compared to anterior cervical discectomy and fusion (ACDF) using a plate and structural allograft for reconstruction of the disc at one level from C3-C7 following single-level discectomy for intractable radiculopathy or myelopathy due to a single-level abnormality localized to the disc space. The first five patients at each site were treated with the SECURE®-C device; subsequent patients were randomized in a 1:1 ratio at each site to receive either the SECURE®-C or control treatment. The purpose of the study was to determine whether the SECURE®-C Cervical Artificial Disc was non-inferior to the control.

Patients were treated between July 7, 2005 and April 25, 2008. A total of 380 patients were enrolled at 18 sites. Of these patients, 89 were non-randomly assigned to SECURE®-C. Of the randomized patients, 151 patients were randomized to SECURE®-C and 140 to control ACDF treatment. Final analysis was conducted after all patients had reached the two year time point; additional analysis was conducted after all patients had reached the seven year time point. The database for this PMA reflects data collected through July 9, 2015.

Clinical Inclusion and Exclusion Criteria

Patients were enrolled in the study according to the following inclusion/exclusion criteria:

Clinical Inclusion Criteria

Enrollment in the SECURE®-C study was limited to patients who met the following inclusion criteria:

- Symptomatic cervical disc disease (SCDD) in one vertebral level between C3-C7, defined as neck or arm (radicular) pain, or functional or neurological deficit and radiographic confirmation (by CT, MRI, X-ray, etc.) of any of the following:
  - Herniated nucleus pulposus;
  - Radiculopathy or myelopathy;
  - Spondylosis (defined by the presence of osteophytes); or
  - Loss of disc height.
- Age between 18 and 60 years
- Failed at least 6 weeks of conservative treatment
- Neck Disability Index (NDI) Questionnaire score of at least 30 (as percentage of 50 point total)
- Able to understand and sign informed consent form
- Psychosocially, mentally and physically able to fully comply with this protocol including adhering to follow-up schedule and filling out forms
- Able to meet the proposed follow-up schedule at 6 weeks, 3 months, 6 months, 12 months and 24 months
- Able to follow postoperative management program

Clinical Exclusion Criteria

Patients were not permitted to enroll in the SECURE®-C study if they met any of the following exclusion criteria:

- More than one vertebral level requiring treatment
- Prior fusion surgery adjacent to the vertebral level being treated
- Prior surgery at the level to be treated
- Clinically compromised vertebral bodies at the affected level(s) due to current or past trauma
- Radiographic confirmation of facet joint disease or degeneration, defined as apparent sclerosis and/or hypertrophy of the facets demonstrated on AP radiographs as a disruption of the normally smooth facet curve
- Marked cervical instability on resting lateral or flexion/extension radiographs:
  - Translation greater than 3mm, and/or
  - More than 11° of rotational difference from that of either adjacent level.
- Severe spondylosis at the level to be treated as characterized by any of the following:
  - Bridging osteophytes;
  - A loss of disc height greater than 50%; or
  - Absence of motion (<2°)
- Neck or arm pain of unknown etiology
- Osteoporosis, osteopenia, Paget's disease, osteomalacia or any other metabolic bone disease
- Pregnant or interested in becoming pregnant in the next 2 years
- Active systemic or local infection
- Known allergy to titanium, polyethylene, cobalt, chromium or molybdenum
- Taking medications or any drug known to potentially interfere with bone/soft tissue healing (e.g., steroids)
- Rheumatoid arthritis or other autoimmune disease
- Systemic disease including AIDS, HIV, Hepatitis
- Active malignancy: A patient with a history of any invasive malignancy (except non-melanoma skin cancer), unless he/she has been treated with curative intent and there has been no clinical signs or symptoms of the malignancy for at least 5 years
- Neuromuscular disorders such as muscular dystrophy, spinal muscular atrophy, amyotrophic lateral sclerosis, etc.
- Acute mental illness or substance abuse
- Use of bone growth stimulator within past 30 days
- Participation in other investigational device or drug clinical trials within 30 days of surgery
- Prisoners

Postoperative Care

The recommended postoperative care included use of an external orthosis for 3 weeks postoperatively, followed by physical therapy program for active range of motion exercises. Patients were instructed to avoid lifting above shoulders for 3 months, and to avoid athletic activities and repetitive bending or lifting for 6 months. Smokers were encouraged not to smoke. Patients were not treated with NSAIDs postoperatively in either treatment group. Some reports in the literature show that short-term postoperative use of NSAIDs may reduce the incidence of heterotopic ossification in some total disc replacement patients.

Follow-up Schedule

All patients were scheduled to return for follow-up examinations at 6 weeks (±2 weeks), 3 months (±2 weeks), 6 months (±1 month), 12 months (±2 months), 24 months (±2 months), and annually thereafter (±2 months), as shown in **Table 2**. All adverse events (device-related or not) were monitored over the course of the study and radiographic assessments were done by an independent core laboratory. All adverse events were independently adjudicated (for adverse event code, severity, and relationship to the device and/or procedure) by a Clinical Events Committee comprised of two practicing spine surgeons. At each evaluation time point, the following clinical and radiographic outcomes were evaluated per the clinical evaluation schedule below: the Neck Disability Index (NDI) to assess pain and function, Visual Analog Scale (VAS) to assess neck and arm pain, neurologic status, general health status as assessed based on the SF-36, medication usage, patient satisfaction with surgery, radiographic parameters, and overall success. Radiographic parameters evaluated included range of motion (angulation and translation), disc height, device displacement, radiolucency, fusion status, and heterotopic ossification. Overall success was determined based on data collected during the initial 24 months of follow-up.

Table 2. Clinical Evaluation Schedule

Evaluation	Pre-op	Surgery/ Hospital Discharge	6 wks	3 mo	6 mo	12 mo	24 mo & annually
Neck Disability Index	X		X	X	X	X	X
Neck and Arm Pain (VAS)	X		X	X	X	X	X
Health Status (SF-36)	X		X	X	X	X	X
Neurological Status	X				X	X	X
Adverse Events*	X	X	X	X	X	X	X
Demographic/Baseline Data	X						
Operative Data		X					
Medication Use	X				X	X	X
Imaging Studies:							
AP & lateral	X	X	X	X	X	X	X

CT and/or MRI	X						
Radiographic Outcomes:							
Range of motion	X				X	X	X
Disc height	X				X	X	X
Device migration			X	X	X	X	X
Fusion status					X	X	X
Radiolucency					X	X	X
Patient Satisfaction						X	X

* Adverse events and complications were recorded at all visits (both scheduled and unscheduled).

Clinical Endpoints

The safety of the SECURE®-C was assessed by comparing the nature and frequency of adverse events (overall and in terms of severity and relationship to the device and/or procedure) and secondary surgical procedures as well as maintenance or improvement in neurological status to the ACDF control group.

The effectiveness of the SECURE®-C was assessed by evaluating improvement in the Neck Disability Index (NDI), neck and arm pain based on a Visual Analog Scale (VAS), and quality of life using the short-form 36 questionnaire (SF-36) as well as patient satisfaction compared to the ACDF control group.

In addition, several radiographic endpoints were considered in evaluating both safety and effectiveness, including range of motion, disc height, device displacement or migration, radiolucency, spinal fusion status, and heterotopic ossification.

Per the protocol, an individual patient was considered a success if the following criteria were met at 24 months:

- Pain/disability improvement of at least 25% in NDI compared to baseline;
- No device failures requiring revision, removal, reoperation, or supplemental fixation;
- Absence of major complications defined as major vessel injury, neurological damage, or nerve injury; and
- For control fusion patients only, radiographic fusion, as defined by the presence of bridging trabecular bone, without evidence of pseudarthrosis (defined radiographically as no apparent bridging trabecular bone and range of motion >3mm in translation and >2° in rotation).

In addition, FDA requested an additional analysis in which an individual patient was considered a success if the following criteria were met at 24 months:

- Pain/disability improvement of at least 15 points in NDI compared to baseline;
- No secondary surgery at the index level including revision, removal, reoperation or supplemental fixation;
- No potentially device-related adverse events;
- Maintenance or improvement in all components of neurologic status; and
- No SECURE®-C intraoperative changes in treatment.

Overall study success criteria were based on a comparison of individual patient success rates, such that the patient success rate for the SECURE®-C investigational group must be non-inferior to that of the ACDF fusion control group. The IDE study was approved using a non-inferiority margin (delta) of 15% with an advisory that a non-inferiority margin of 10% would be required to demonstrate a reasonable assurance of the device's effectiveness. According to the statistical analysis plan, if non-inferiority was demonstrated, then superiority would be evaluated as defined more specifically in the analysis plan. Of note, the statistical analysis plan pre-specified that the analysis technique would involve predicting 24 month outcomes for those without them, based on interim 6 month and 12 month observed outcomes, and integrating over the predictions to obtain posterior probabilities of non-inferiority and superiority.

Secondary effectiveness evaluations specified in the protocol included comparisons of the following:

- Components of the primary
  - Pain/Disability Improvement (NDI)
  - No device failures requiring revision, re-operation or removal
  - Absence of major complications
- Neck Disability Index: 25% improvement from baseline
- VAS pain scales (neck, right, and left arm): 20mm improvement from baseline
- Health Status Survey SF-36 (mental and physical composite scores): 15% improvement from baseline
- Neurological status (maintenance, worsening, or improvement): proportion of patients maintained or improved
- Mean range of motion (angulation and translation)
- Disc height on standard lateral radiograph: 2mm changes compared to baseline
- No significant radiolucency for the SECURE®-C device: proportion of patients
- Spinal fusion in the control arm
- Patient satisfaction (definitely/mostly): proportion of patients
- Device displacement or migration (>3mm)
- Operative time
- Operative blood loss
- Return to work

Accountability of PMA Cohort

A total of 380 patients at 18 sites were enrolled and treated in the IDE clinical trial; 236 received SECURE®-C (88 non-randomized, 148 randomized) and 144 received control treatment. All of the 380 patients enrolled in the PMA study have reached the 84 month post-operative visit; 331 (87.1%) had 24 month data available for analysis and 288 (75.8%) had 84 month data available for analysis at the completion of the study. Complete primary endpoint data (including fusion status for control group patients) was available for 215 investigational (77 non-randomized, 138 randomized) and 98 control patients at 24 months, and for 185 investigational (61 non-randomized, 124 randomized) and 101 control patients at 84 months. A total of 10 investigational (4 non-randomized and 6 randomized) and 22 control patients had failures at or prior to the 84 month visit. A summary of annual patient accountability data is provided in **Table 3**.

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; R ACDF=Control

* A total of 380 patients at 18 sites were enrolled and treated in the IDE clinical trial; 236 received SECURE®-C (88 non-randomized, 148 randomized) and 144 received control treatment. Four patients intended to be treated with SECURE®-C (1 non-randomized and 3 randomized) were intraoperatively treated by the investigator with ACDF; one was due to a randomization error by the site, one was due to inability to visualize the disc space due to the patient's large shoulders, and two were due to small patient anatomy.

1 Deaths and failures are cumulative
2 Theoretical patients minus the number of deaths, failures, and not yet overdue
3 Patients with complete efficacy data
4 Patients with complete efficacy data within the specified visit window
5 Patients with any information recorded at the visit

The as-treated population is used for safety analyses (88 non-randomized SECURE®-C, 148 randomized SECURE®-C, 144 ACDF) and the as-randomized population is used for efficacy analyses (89 non-randomized SECURE®-C, 151 randomized SECURE®-C, 140 ACDF). Statistical comparisons for efficacy are made between randomized groups, for patients as they were intended to be treated, referred to as the "As-Randomized" population. Safety comparison such as adverse events and radiographic measurements are made between randomized groups, for patients as they were actually treated, referred to as the "As-Treated" population.

Study Population Demographics and Baseline Parameters

The demographics of the study population are typical for a cervical artificial disc study performed in the US. Select demographic data and preoperative evaluations for all patients enrolled and treated in the study are included in **Table 4** and **Table 5**. Bayesian Credible Intervals (BCIs) between the randomized groups are presented for all comparison tables. There were no differences in gender, age, race (caucasian vs. other), height, weight or BMI between the two randomized groups, as evidenced by the 95% BCIs all containing zero. In addition, there were no differences in preoperative evaluations (NDI, VAS, SF-36) between the two randomized groups, except for SF-36 PCS which was slightly higher for the SECURE®-C group.

Table 4. Patient Demographics and Baseline Characteristics

* Per FDA, VAS data excludes one site in which some scores were reported verbally rather than written

Surgery and Hospitalization

Surgical data is provided in **Table 6**. BCIs for the difference on the mean or proportion between the randomized SECURE®-C group minus the ACDF group are included in the table. The most common surgical levels were C5-C6 and C6-C7. Mean surgery time was 15.6 min longer for the randomized investigational SECURE®-C group than for the control ACDF group (95% BCI: 8.8, 22.4). Mean blood loss was also higher by 9.6 milliliters in the randomized SECURE®-C group, which is likely not clinically significant. Mean return to work time was 6 days shorter for the SECURE®-C group than the ACDF group (95% BCI: -24.7%, 12.7%).

Table 6. Surgical Data

Measure	Non-Randomized SECURE®-C (N=89)	Randomized SECURE®-C (N=151)	Randomized ACDF (N=140)	95% BCI* (Rand SEC-C – Rand ACDF)

Device Combination			
11mm x 12mm footprint and 7mm height			69 (29.2%)
13mm x 14mm footprint and 7mm height			136 (57.6%)
13mm x 14mm footprint and 8mm height			22 (9.3%)
13mm x 14mm footprint and 9mm height			1 (0.4%)
14mm x 16mm footprint and 7mm height			5 (2.1%)
14mm x 16mm footprint and 8mm height			3 (1.3%)

Safety and Effectiveness Results

Safety Results

The analysis of safety was based on the as-treated cohort of 380 total patients (88 non-randomized SECURE®-C patients, 148 randomized SECURE®-C patients, and 144 ACDF patients). A summary of the total number of adverse events, events classified by the Clinical Events Committee (CEC) as device-related, events classified by the CEC as surgery-related, events classified by the CEC as severe or life-threatening, events within 48 hours of the original procedure, and device failures (defined as a revision, removal, reoperation or supplemental fixation) are shown in **Table 8**.

Table 8. Adverse Event Summary

		NR SEC (N=88)	R SEC (N=148)	R ACDF (N=144)	95% BCI* (lower, upper)

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; R ACDF=Control
*95% BCI (lower, upper) for comparison of the difference (SECURE®-C - control) between randomized groups
Note: For statistical comparisons of only randomized patients, ACDF group excludes 1 non-randomized patient, therefore N=143.

Table 9 provides data on the total number of adverse events in each treatment group stratified by level treated. The percentage of subjects with adverse events was similar for the SECURE®-C and ACDF groups, for all treated levels.

Table 9. Total Adverse Events by Level Treated

Level Treated	NR SEC	R SEC	R ACDF	95% BCI (lower, upper)
C3-4	1/3 (33.3%)	5/5 (100%)	4/4 (100%)	(-35.3%, 42.4%)
C4-5	6/7 (85.7%)	8/8 (100%)	11/11 (100%)	(-28.0%, 20.1%)
C5-6	38/47 (80.9%)	68/74 (91.9%)	65/72 (90.3%)	(-9.0%, 9.8%)
C6-7	28/31 (90.3%)	51/61 (83.6%)	50/57 (87.7%)	(-16.6%, 8.9%)

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; R ACDF=Control

The adverse events reported in the PMA clinical study from all 236 SECURE®-C patients and 144 ACDF patients are shown in **Table 10**. This table includes adverse events from all patients, randomized and non-randomized, to establish the safety profile of the device. Adverse events are listed in alphabetical order. Definitions of adverse event categories are provided in **Table 11**. Adverse event rates are based on the number of patients having at least one occurrence of an adverse event, divided by the number of patients in that treatment group. Events per patient are based on the number of adverse events, divided by the number of patients. Note that patients with the same event reported within a window are counted once but may appear in multiple time points for the same event. The overall adverse event profile (percentage of patients experiencing at least one adverse event) is numerically lower for the SECURE®-C group (86.9%) than the control ACDF group (90.3%), but is not statistically different. In addition, the overall number of adverse events per patient is lower for the SECURE®-C group(s) than the ACDF group. In the SECURE®-C group, the most common adverse events were neck pain, upper extremity pain, back and/or lower extremity pain, and trauma.

A total of 4 SECURE®-C patients (3 non-randomized, 1 randomized) and 2 control ACDF patients died during the study. One non-randomized SECURE®-C patient died of cardiopulmonary arrest 210 days after surgery. The patient had poor cardiovascular fitness and the event was not considered to be associated with the device by the investigator or the Clinical Events Committee (CEC). The second non-randomized SECURE®-C patient died of metastatic esophageal cancer 1324 days (3.6 years) after surgery. The third non-randomized SECURE®-C patient and one randomized SECURE®-C patient died of unknown causes 2341 days (6.5 years) and 3078 (8.5 years) after surgery, respectively. One randomized ACDF patient died of unknown causes 1111 days after surgery. The second randomized ACDF patient died of suicide 2411 days (6.5 years) after surgery. No other patients died during the study.

SEC = all SECURE®-C Cervical Artificial Disc; ACF = Anterior Cervical Discectomy and Fusion (Control)

[1] 3 non-randomized SEC: prostate cancer at 692 days, metastatic colon cancer at 959 days, metastatic esophageal cancer at 979 days; 1 randomized SEC: lymphoma at 358 days

* Other: diabetes (SEC, ACDF), thyroid disease (2 SEC, ACDF), hemolytic syndrome (SEC), Wegener's granulomatosis (SEC), CSF leak after lumbar ESI (SEC), corneal abrasion (SEC), allergic reaction to medication (SEC) or to cervical collar material (2 ACDF), lightheadedness (SEC), flu symptoms (ACDF), occasional clicking (ACDF), mild lump in throat without dysphagia (SEC), and snoring (SEC).

Table 11. Adverse Event Categories

Category	Definition
Cancer	A malignancy or malignant tumor/neoplasm
Cardiovascular	Any condition of the heart and/or blood vessels (excluding the blood vessels that supply the brain)
Carpal Tunnel Syndrome (CTS)	Condition with entrapment of the median nerve in the carpal tunnel
Cerebrovascular	Any condition relating to the brain and the blood vessels that supply it
Compressive Peripheral Neuropathy (Non-CTS)	Dysfunction of one or more nerves excluding Carpal Tunnel Syndome
Death	The termination of life
Dysesthesia - Lower Extremities	Dysesthesia in the lower extremities including hips, buttocks, legs, knees, feet, toes
Dysesthesia - Other	Dysesthesia in areas excluding the upper and lower extremities
Dysesthesia - Upper Extremities	Dysesthesia in the upper extremities including include neck, shoulders, arms, elbows, hands, fingers
Dysphagia	Difficulty in swallowing
Dysphonia	Difficulty in speaking
Endocrinology	Any condition relating to the endocrine system
Gastrointestinal	Any condition pertaining to the stomach and intestines
Headache	Pain in various parts of the head, but not confined to the area of distribution of any nerve
Infection - Superficial Wound	An infection near the surface of the surgical incision
Infection - Other	An infection in an area other than the surgical incision
Muscle Spasms	A sudden contraction of muscle(s), excluding neck or upper extremity spasms which are considered to be pain
Musculoskeletal	Any condition pertaining to the muscles and skeleton, such as fracture, ligament tear, arthritis of any kind, and degenerative conditions, excluding muscle spasms and events related to spinal degenerative conditions
Neurological	Any condition pertaining to a disorder of the nervous system, e.g. Multiple Sclerosis, Parkinson's Disease, Alzheimer's
Other	An adverse event not associated with any other term
Pain - Back and/or Lower Extremities	Pain* (including stiffness, strain, tightness) in back, and/or hip, leg, ankle, feet, or buttock; includes pain with or without dysesthesia
Pain - Neck	Pain* in the neck
Pain - Neck and Upper Extremities	Pain* in the neck *and* shoulder, arm, wrist, or hand
Pain - Neck and Upper Extremities with Dysesthesia	Pain* in the neck *and* shoulder, arm, wrist, or hand w/ dysesthesia
Pain - Neck with Dysesthesia	Pain* in the neck with dysesthesia
Pain - Other	Pain* in an area that is not the back or lower extremities, or the neck or upper extremities
Pain - Upper Extremities	Pain* in the shoulder, arm, wrist or hand
Pain - Upper Extremities with Dysesthesia	Pain* in the shoulder, arm, wrist or hand with dysesthesia
Psychological	Any psychological condition
Respiratory	Any condition related to inhalation and exhalation, or the respiratory system
Surgery - Index Level	A secondary surgical procedure performed at the index level (originally treated) of the cervical spine, which may include an adjacent level if the index level is operated at same time
Surgery - Adjacent Level	A surgical procedure performed at an adjacent level or level(s) to the index surgery only
Surgery - Other Cervical	A surgical procedure performed at a cervical level that is not the index level or adjacent level(s)
Surgery - Thoracic Level	A surgical procedure performed at a thoracic level or levels, that is an adjacent level(s) to the index surgery
Surgery - Lumbar Level	A surgical procedure performed at a lumbar level.
Trauma	Physical injury caused by a physical force or traumatic event (e.g. motor vehicle accident, fall, etc.)
Urogenital	Any condition of, relating to, affecting, treating, or being the organs or functions of excretion and reproduction
Weakness	Any symptom of weakness or fatigue of the neck and/or upper extremities, not associated with pain or dysesthesia
Wound Issue	Any issue of surgical incision, such as hematoma, excluding infection

Bayesian methods were used to analyze the primary endpoint, and were also used to compare adverse events in the randomized groups. The analysis results are provided in **Table 12**, with 95% Bayesian Credible Intervals (BCI) for the difference in adverse event rates (SECURE®-C – ACDF). BCIs that include zero indicate no statistical difference in proportions between randomized groups. Based on the BCIs, there were no differences between groups for all adverse events, except surgery-index level, which is lower for SECURE®-C, and cardiovascular, which is higher for SECURE®-C.

Table 12. Statistical Comparison of Adverse Events (Randomized Patients As Treated)

Adverse Event	Patients Experiencing Adverse Events (%)		95% BCI (lower, upper)
	SEC (N=148)	ACDF (N=143)	
Any Adverse Event	**132 (89.2%)**	**130 (90.9%)**	**(-8.7%, 5.3%)**
Cancer	2 (1.4%)	4 (2.8%)	(-5.4%, 2.2%)
Cardiovascular	14 (9.5%)	4 (2.8%)	(1.1%, 12.4%)
Carpal Tunnel Syndrome (CTS)	11 (7.4%)	13 (9.1%)	(-8.2%, 4.8%)
Cerebrovascular	1 (0.7%)	2 (1.4%)	(-3.9%, 2.2%)

Wound Issue	1 (0.7%)	4 (2.8%)	(-5.9%, 1.2%)

SEC = all SECURE®-C Cervical Artificial Disc; ACDF = Anterior Cervical Discectomy and Fusion (Control)
*Other previously defined in Table 2

Table 13 provides a higher level comparison of all pain adverse events that occurred in the study. There were no statistical differences between randomized groups for all pain categories listed. Rates were higher for ACDF than for SECURE®-C in all categories, but the differences were not statistically significant.

Table 13. Pain Adverse Events (All Treated Subjects)

Category	NR SEC (N=88)	R SEC (N=148)	R ACDF (N=144)	95% BCI (lower, upper)*

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; R ACDF=Control
*For statistical comparisons of only randomized patients, ACDF group excludes 1 non-randomized patient, therefore N=143.

Some adverse events resulted in surgical intervention at the index level, subsequent to the initial surgery. Secondary surgical interventions, classified as revisions, removals, reoperations or supplemental fixations at the index level, are study failures and are reported in **Table 14**, with details provided in **Table 15**. The percentage of patients experiencing secondary surgery at the index level was lower for the SECURE®-C group (2.5%) than the ACDF group (9.7%).

Table 14. Secondary Surgical Procedures Interventions at the Index Level (All Patients As Treated)

ACDF	Neck pain and right upper extremity pain	Removal C5-6, plate and cage inserted C6-7	1407
ACDF	Adjacent segment disease	C4-6 extension of fusion	1575
ACDF	Neck and arm pain, C5-6 disc degeneration	Removal C6-7, cervical arthroplasty inserted at C5-6	1576
ACDF	Neck and left arm pain	Removal C6-7, 2-level plate/2 spacers inserted C4-6	1750
ACDF	Left arm pain	Removal C5-6, plate and autograft inserted same level	1804
ACDF	Neck and shoulder pain	Removal of plate and screws C5-6, corpectomy C5-6 and ACDF C4-C7	1924
ACDF	Cervical spondylosis and myelopathy	Removal of plate at C6-7 and adjacent level surgery at C4-5 and C5-6	2156
ACDF	Neck and left arm pain	Removal C5-6 (partial), plate/spacer inserted C4-5 and C6-7	2623
ACDF	Neck and arm pain and numbness	Removal of plate C5-6, allograft spacer inserted at C4-5 and C6-7 and anterior plate from C4-7	3155

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; ACDF=Control

The number and percentage of patients who experienced a device-related adverse event as determined by the Clinical Events Committee (CEC) is provided in **Table 16**. Device-related events were identified as having etiology, temporal association, or cause, that is related to the device, such as: revision, removal, reoperation, or supplemental fixation at the index level, surgery at the index level to remove or alter the device, fracture or mechanical failure of device(s), pseudarthrosis, radiolucency around device(s), migration, subsidence, loosening, etc. The CEC felt that it was not appropriate to broadly classify events such as neck or arm pain as potentially device related, as these are commonly reported symptoms for patients entering a study with preoperative neck and/or arm pain.

Based on the CEC's classification, the device-related adverse event profile is lower for the randomized SECURE®-C (4.2%) group than the ACDF (15.3%) group because there were fewer secondary surgeries at the index level in the SECURE®-C group.

Table 16. Device-Related Adverse Events

Adverse Event	Intra-Op (0-2 days)		Peri-Op (>2days-6wks)		Short Term (>6wks-12mo)		Long Term (>12mo-24mo)		Longer Term (>24-60mo)		Longer Term (>60-84mo)		Longer Term (>84mo)		Patients (%)

SEC = all SECURE®-C Cervical Artificial Disc; ACDF = Anterior Cervical Discectomy and Fusion (Control)

The change in neurologic status at each study timepoint is provided in **Table 17** for all patient groups. If any one of the four neurologic assessments deteriorated, then the overall neurologic status is considered deteriorated. For overall neurologic status and for each of the four individual assessments, the percentage of patients with stable or improved status was similar for both groups. The randomized SECURE®-C group demonstrated numerically greater percentages of patients with stable/improved neurologic status than the control ACDF group at each time point; statistical comparisons of 24 month and 84 month neurologic status success demonstrate non-inferiority with a posterior probability of 100%.

Table 17. Neurological Status

Timepoint	Status	Non-Randomized SECURE®-C (N=88)	Randomized SECURE®-C (N=148)	Randomized ACDF (N=144)	95% BCI[#] (lower, upper)
6 months	Improved Stable Deteriorated	51/83 (61.4%) 27/83 (32.5%) 5/83 (6.0%)	82/139 (59.0%) 53/139 (38.1%) 4/139 (2.9%)	73/130 (56.2%) 45/130 (34.6%) 12/130 (9.2%)	(0.7%, 12.6%)

60 months	Improved Stable Deteriorated	16/27 (59.3%) 8/27 (29.6%) 3/27 (11.1%)	33/41 (80.5%) 6/41 (14.6%) 2/41 (4.9%)	28/38 (73.7%) 9/38 (23.7%) 1/38 (2.6%)	(-12.5%, 8.3%)
72 months	Improved Stable Deteriorated	13/20 (65.0%) 6/20 (30.0%) 1/20 (5.0%)	49/69 (71.0%) 17/69 (24.6%) 3/69 (4.3%)	33/50 (66.0%) 14/50 (28.0%) 3/50 (6.0%)	(-6.5%, 11.7%)
84 months	Improved Stable Deteriorated	42/62 (67.7%) 16/62 (25.8%) 4/62 (6.5%)	87/121 (71.9%) 27/121 (22.3%) 7/121 (5.8%)	72/109 (66.1%) 23/109 (21.1%) 14/109 (12.8%)	(-0.4%, 15.1%)

[#]95% Credible Interval on difference (SECURE®-C randomized – ACDF) between proportions of improved/stable vs. deteriorated

Effectiveness Results

Primary Effectiveness Analysis

The analysis of effectiveness was based on the as-randomized cohort of 380 total patients (89 non-randomized SECURE®-C patients, 151 randomized SECURE®-C patients, and 140 ACDF patients). The individual patient success rate was defined as the number of patients classified as success divided by the number of patients evaluated at 24, 60 and 84 months. The success rates for each of the individual success components and the overall success is provided in **Table 18** for both randomized groups at 24, 60 and 84 months.

Posterior probabilities of non-inferiority and superiority were calculated using Bayesian statistical methods. The statistical analysis plan pre-specified that the analysis technique would involve predicting 24 month outcomes for those without them, based on interim 6 month and 12 month observed outcomes, and integrating over the predictions to obtain posterior probabilities of non-inferiority and superiority.

The study was approved using a non-inferiority margin (delta) of 15%; FDA advised that additional analysis be performed with a margin of 10% at the time of PMA. Only the 10% delta analysis is presented; 15% non-inferiority is always met for all variables demonstrating non-inferiority at 10%. According to the statistical analysis plan, if non-inferiority was determined, then superiority would be evaluated; these results are also presented.

In addition to the protocol-defined overall success criteria, FDA requested an additional alternative definition of overall success to include improvement in NDI of 15 points, maintenance or improvement in neurologic status, absence of device-related adverse events, exclusion of fusion criteria, and no intraoperative changes in SECURE®-C treatment (i.e., intraoperative conversion to fusion). Analysis using the alternative FDA-defined endpoint is provided in **Table 19**.

Table 18. Overall Success at 24, 60 and 84 Months Using Protocol-Specified Definition

[#]BCI for difference in proportions (SECURE®-C – ACDF), using Bayesian methods

As specified in the analysis plan, the threshold for establishing success for non-inferiority or superiority is a posterior probability of 95.4%. Therefore, overall success results demonstrate non-inferiority of the SECURE®-C group to the control group. In addition, all components of overall success of the SECURE®-C group were non-inferior to the control group. Statistical conclusions at 60 months were not possible due to missing data. **Superiority of the SECURE®-C investigational group to the control was established for overall success at 24 and 84 months, with a posterior probability of 99.9% and 100%, respectively, for the protocol-specified definition and 98.8% and 99.9%, respectively, for the alternative FDA definition.**

The timecourse of overall success for each treatment group is shown in **Table 20**.

Table 20. Timecourse of Overall Success

Definition	Group	6 mo	12 mo	24 mo	36 mo	48 mo	60 mo	72 mo	84 mo

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; R ACDF=Control

Overall success for each treatment group stratified by level treated is presented in **Table 21**. At C5-6 and C6-7 at 24 months, C4-5 at 60 months, and C5-6 at 84 months for the protocol specified definition of overall success, and at C4-5 at 60 months for the FDA-specified definition, the proportion of SECURE®-C patients achieving overall success was higher than ACDF patients. There were no other statistical differences in overall success between the randomized groups.

[#]BCI for difference in proportions (SECURE®-C randomized – ACDF), using Bayesian methods

Various post-hoc sensitivity analyses were conducted to assess the robustness of the study conclusions. Additional analyses were provided on overall success stratified by: preoperative radiographic findings, pain status, neurologic status, instability, motion, duration of neck symptoms, and history of conservative care; without Bayesian predictions, without 6 month data in the predictions, and with missing interim outcomes set to worst case values; with ACDF patients with adjacent level subsequent surgery in which the device was removed but not replaced were considered successes rather than failures; using only in-window data; with imputations for missing values including a last observation carried forward analysis, a worst case analysis, and a tipping point analysis; and excluding subjects with major protocol violations. Non-inferiority was established for nearly all of these scenarios for both the protocol-specified and FDA-defined alternate endpoints except the most extreme case in which all missing investigational outcomes are considered failures and all missing control outcomes are considered successes where non-inferiority was only established for the protocol-specified endpoint.

Additional data was provided which stratified outcomes by patient race as shown in **Tables 22** and **23**.

Table 22. Overall Success by Patient Race

[#]BCI for difference in proportions (SECURE®-C randomized – ACDF), without predictions

For patients randomized to SECURE®-C, the Caucasian group had higher success rates at 24 months than the non-Caucasian group for both overall success definitions; there were no differences between the Caucasian and non-Caucasian groups at 60 or 84 months. For patients randomized to ACDF, there was no difference between the Caucasian and non-Caucasian groups except at 84 months where the Caucasian group had a higher success rate using the FDA-defined overall success definition.

Within the Caucasian group, those treated with the SECURE®-C have higher success rates than those treated with ACDF, whereas within the non-Caucasian group, the outcomes are not statistically different.

Secondary Effectiveness Analysis

In addition to the components of primary success, secondary effectiveness variables were assessed including VAS Neck and Arm Pain, SF-36 Health Status Survey, Patient Satisfaction, Return to Work, Radiographic, and Neurologic Status. The threshold for establishing non-inferiority or superiority for secondary objectives was 95% with a non-inferiority margin of 10%.

The following secondary endpoint success definitions were specified:

- NDI success: improvement of both ≥25% and ≥15 points from baseline
- VAS pain success: improvement of ≥20mm
- SF-36 success: improvement of ≥15%
- Satisfaction: response of definitely or mostly satisfied

Success rates at 24, 60, and 84 months based on these definitions are presented in **Table 24**. SECURE®-C was non-inferior to ACDF for all measures, except right arm pain success at 24 months, neck pain, right arm pain and alt left arm pain success at 60 months, and SF-36 PCS success at 84 months. An additional post-hoc analysis for neck, right arm and left arm pain was performed in which success was defined as either 20mm improvement or zero (0mm) pain at the postoperative visit. In this analysis, SECURE®-C is non-inferior to ACDF at 24 months for VAS right arm pain success and for VAS neck and left arm pain at 60 months.

Table 24. Secondary Effectiveness Endpoints – Function, Health, and Satisfaction

Satisfaction	120/125 (96.0%)	95/107 (88.8%)	(1.3%, 16.4%)

[#]BCI for difference in proportions (Randomized SECURE®-C – ACDF)
*Alternate definition of VAS success defined post hoc as either 20mm pain improvement or 0mm pain at the postoperative visit.

For patients receiving the SECURE®-C device, the mean angular range of motion values at 12, 24 and 84 months postoperative were 10.0°, 9.6°, and 9.2°, respectively, compared to 8.9° at the preoperative evaluation. The mean translational range of motion values at 12, 24 and 84 months postoperative was 1.2mm, 1.2mm and 1.1mm, respectively, compared to 1.0mm preoperatively.

The average angulation range of motion (flexion-extension) and range of results for all SECURE®-C patients at preoperative and postoperative time periods are shown in **Figure 1.**

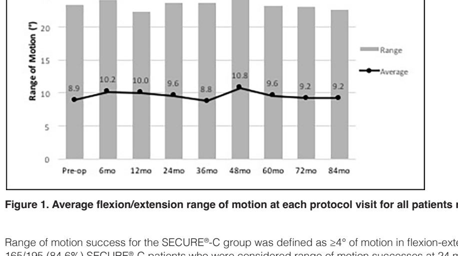

Figure 1. Average flexion/extension range of motion at each protocol visit for all patients receiving SECURE®-C.

Range of motion success for the SECURE®-C group was defined as ≥4° of motion in flexion-extension or maintenance of motion relative to preoperative baseline. Of the 165/195 (84.6%) SECURE®-C patients who were considered range of motion successes at 24 months (including both non-randomized and randomized patients), 160/165 (97.0%) achieved ≥4° of motion in flexion-extension, 101/165 (61.2%) maintained motion from preoperative baseline, and 96/165 (58.1%) were successes under both criteria. Only 5/165 (3.0%) maintained motion from preoperative baseline but had <4° of motion.

Table 25 presents data on change in range of motion from preoperative baseline for each timepoint by treatment group.

Table 25. Radiographic Change in Range of Motion for SECURE®-C

Group	Category	6 mo	12 mo	24 mo	36 mo

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; All SEC=Both Non-randomized and Randomized SECURE®-C

A histogram of angular range of motion on flexion/extension radiographs at 24 months for all patients treated with SECURE®-C is provided in **Figure 2** (values are rounded to the nearest integer).

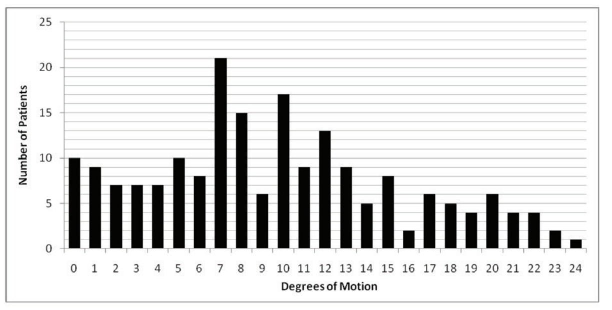

Figure 2. Histogram of flexion/extension range of motion for SECURE®-C patients at 24 months.

Analysis of the correlation between range of motion and overall success (both definitions) as well as NDI and VAS pain scores was done by evaluating the percentage of patients successful on each outcome stratified by range of motion status (≥4° or <4° on flexion/extension) as well as by evaluating correlation plots. No meaningful correlations were found between range of motion and overall success or NDI or VAS pain outcomes for absolute values or changes from baseline.

Radiographic evaluation of mean disc height for the treated level at the preoperative and 24 month time points are shown in **Table 26** for all subjects. Change in disc height success (>2mm) for the treatment groups is shown below in **Table 27**.

Table 26. Radiographic Disc Height (mm)

Time Period	NR SEC	R SEC	ACDF
Preoperative	3.7 ±0.78	3.8 ±0.76	3.6 ±0.75
24 months	5.9 ±0.84	5.8 ±0.95	4.2 ±1.30
60 months	5.8 ±1.00	5.5 ±1.01	3.9 ±1.61
84 months	5.6 ±0.90	5.5 ±0.94	4.2 ±1.29

NR SEC=Non-randomized SECURE®-C; R SEC=Randomized SECURE®-C; ACDF=Control

Table 27. Secondary Effectiveness Endpoints – Radiographic Measurements

Component	Visit	Non-Randomized SECURE®-C	Randomized SECURE®-C	ACDF	95% BCI[#] (lower, upper)
Disc Height Change (>2mm)	24 mo	42/72 (58.3%)	49/119 (41.2%)	16/96 (16.7%)	(15.3%, 36.0%)
	60 mo	18/26 (69.2%)	14/33 (42.4%)	4/32 (12.5%)	(12.3%, 38.8%)
	84 mo	30/58 (51.7%)	46/115 (40.0%)	15/101 (14.9%)	(16.3%, 36.3%)

[#]Comparison on the difference (SECURE®-C - control) between proportions in randomized groups

Radiolucencies around the implant of more than 25% were evaluated; none (0%) of the SECURE®-C patients and 4/104 (3.8%) ACDF patients demonstrated radiolucencies around the implant at 24 months, and no other radiolucencies at other time periods. There were no device migrations or displacements, including superior or inferior subsidence observed in any SECURE®-C patients.

Radiographic fusion for control patients was defined by the presence of bridging trabecular bone, without evidence of pseudarthrosis, and flexion-extension range of motion ≤2° in rotation and ≤3mm in translation. At 24 months, 89.1% (90/101) of control ACDF patients demonstrated radiographic fusion; at 84 months, 95.8% (92/96) demonstrated radiographic fusion.

Available radiographs for all treated SECURE®-C patients were assessed by an independent radiographic evaluator for heterotopic ossification (HO) grade, based on the Mehren[1] classification system, as well as to determine the number of patients with stable or "worsening" (progressing by at least one grade) HO from visit to visit. **Table 28** shows 24 month HO results.

Table 28. Heterotopic Ossification for All SECURE®-C Subjects at 24, 60 and 84 months

Time Period/Grade	Non-Randomized SECURE®-C	Randomized SECURE®-C	ALL SECURE®-C
24 months			
Grade 0	21/76 (27.6%)	30/122 (24.6%)	51/198 (25.8%)
Grade I	19/76 (25.0%)	22/122 (18.0%)	41/198 (20.7%)
Grade II	25/76 (32.9%)	44/122 (36.1%)	69/198 (34.8%)
Grade III	9/76 (11.8%)	16/122 (13.1%)	25/198 (12.6%)
Grade IV	2/76 (2.6%)	10/122 (8.2%)	12/198 (6.1%)
Stable	45/75 (60.0%)	71/116 (61.2%)	116/191 (60.7%)
Worsening	30/75 (40.0%)	45/116 (38.8%)	75/191 (39.3%)
60 months			
Grade 0	0/26 (0.0%)	3/36 (8.3%)	3/62 (4.8%)
Grade I	11/26 (42.3%)	4/36 (11.1%)	15/62 (24.2%)
Grade II	13/26 (50.0%)	19/36 (52.8%)	32/62 (51.6%)
Grade III	2/26 (7.7%)	5/36 (13.9%)	7/62 (11.3%)
Grade IV	0/26 (0.0%)	5/36 (13.9%)	5/62 (8.1%)
Stable	10/13 (76.9%)	9/10 (90.0%)	19/23 (82.6%)
Worsening	3/62 (23.1%)	1/10 (10.0%)	4/23 (17.4%)
84 months			
Grade 0	0/62 (0.0%)	5/120 (4.2%)	5/182 (2.7%)
Grade I	12/62 (19.4%)	7/120 (5.8%)	19/182 (10.4%)
Grade II	36/62 (58.1%)	75/120 (62.5%)	111/182 (61.0%)
Grade III	9/62 (14.5%)	21/120 (17.5%)	30/182 (16.5%)
Grade IV	2/62 (3.2%)	12/120 (10.0%)	14/182 (7.7%)
Stable	17/17 (100.0%)	60/65 (92.3%)	77/82 (93.9%)
Worsening	0/17 (0.0%)	5/65 (7.7%)	5/82 (6.1%)

[1] Mehren C, et al. Heterotopic Ossification in Total Cervical Artificial Disc Replacement. Spine 31(24):2802-2806, 2006.

The percentage of patients with range of motion ≥4° at 24 months for each HO grade is shown in **Table 29**. Overall, 82.1% of SECURE®-C patients have ≥4° motion at 24 months, and 84.4% have ≥4° motion at 84 months.

Table 29. Range of Motion (ROM) ≥4° by HO Grade for All SECURE®-C Subjects at 24, 60 and 84 months

Variable	Grade 0 (N=51)	Grade I (N=40)	Grade II (N=69)	Grade III (N=25)	Grade IV (N=13)	Total
24 months						
Patients w/ ROM ≥4°	50/51	37/40	59/67	14/24	0/13	160/195
Percentage	98.0%	92.5%	88.1%	58.3%	0.0%	82.1%
60 months						
Patients w/ ROM ≥4°	3/3	12/13	24/27	5/7	0/5	44/55
Percentage	100.0%	92.3%	88.9%	71.4%	0.0%	80.0%
84 months						
Patients w/ ROM ≥4°	3/3	16/17	99/104	22/30	1/13	141/167
Percentage	100.0%	94.1%	95.2%	73.3%	7.7%	84.4%

Conclusions Drawn from the Study Data

The clinical data support the reasonable assurance of safety and effectiveness of the SECURE®-C device when used in accordance with the indications for use. Based on the clinical study results through 7 years (84 months) postoperative, it is reasonable to conclude that the clinical benefits of the use of the SECURE®-C device in terms of improvement in pain and disability, and the potential for motion preservation, appear to outweigh the risks associated with the device and surgical procedure when used in the indicated population in accordance with the directions for use.

Enhanced Surveillance

An Enhanced Surveillance Study was conducted to follow the general patient population with SECURE®-C implants over the 10-year period after PMA approval. In that time period, adverse events reported for any reason in the general population occurred at a rate of approximately 1% or less, which is lower than the rate of adverse events observed in the clinical trial. No new safety signals or concerns were found.

PACKAGING

SECURE®-C implants are supplied pre-packaged and sterile, using gamma irradiation. The integrity of the sterile packaging should be checked to ensure that sterility of the contents is not compromised. Packaging should be carefully checked for completeness and all components should be carefully checked to ensure that there is no damage prior to use. Damaged packages or products should not be used, and should be returned to Globus Medical. During surgery, after the correct size has been determined, remove the implants from the packaging using aseptic technique.

The instrument sets are provided non-sterile and are steam sterilized prior to use, as described in the STERILIZATION section below. Following use or exposure to soil, instruments must be cleaned, as described in the CLEANING section below.

HANDLING

All instruments and implants should be treated with care. Improper use or handling may lead to damage and/or possible malfunction. Instruments should be checked to ensure that they are in working order prior to surgery. All instruments should be inspected prior to use to ensure that there is no unacceptable deterioration such as corrosion, discoloration, pitting, cracked seals, etc. Non-working or damaged instruments should not be used, and should be returned to Globus Medical.

CLEANING

All instruments that can be disassembled must be disassembled for cleaning. The Narrow Implant Holder is disassembled by unthreading the handle/sleeve and removing it from the working end. The Single Endplate Positioner is disassembled by unthreading the adjustable stop. All handles must be detached. Instruments may be reassembled following sterilization. The instruments should be cleaned using neutral cleaners before sterilization and introduction into a sterile surgical field or (if applicable) return of the product to Globus Medical.

Cleaning and disinfecting of instruments can be performed with aldehyde-free solvents at higher temperatures. Cleaning and decontamination must include the use of neutral cleaners followed by a deionized water rinse. Note: certain cleaning solutions such as those containing formalin, glutaraldehyde, bleach and/or other alkaline cleaners may damage some devices, particularly instruments; these solutions should not be used.

The following cleaning methods should be observed when cleaning instruments after use or exposure to soil, and prior to sterilization:

1. Immediately following use, ensure that the instruments are wiped down to remove all visible soil and kept from drying by submerging or covering with a wet towel.
2. Disassemble all instruments that can be disassembled.
3. Rinse the instruments under running tap water to remove all visible soil. Flush the lumens a minimum of 3 times, until the lumens flush clean.
4. Prepare Enzol® (or a similar enzymatic detergent) per manufacturer's recommendations.
5. Immerse the instruments in the detergent and allow them to soak for a minimum of 2 minutes.
6. Use a soft bristled brush to thoroughly clean the instruments. Use a pipe cleaner for any lumens. Pay close attention to hard to reach areas.
7. Using a sterile syringe, draw up the enzymatic detergent solution. Flush any lumens and hard to reach areas until no soil is seen exiting the area.
8. Remove the instruments from the detergent and rinse them in running warm tap water.
9. Prepare Enzol® (or a similar enzymatic detergent) per manufacturer's recommendations in an ultrasonic cleaner.
10. Completely immerse the instruments in the ultrasonic cleaner and ensure detergent is in lumens by flushing the lumens. Sonicate for a minimum of 3 minutes.
11. Remove the instruments from the detergent and rinse them in running deionized water or reverse osmosis water for a minimum of 2 minutes.
12. Dry instruments using a clean soft cloth and filtered pressurized air.
13. Visually inspect each instrument for visible soil. If visible soil is present, then repeat cleaning process starting with Step 3.

STERILIZATION

SECURE®-C Cervical Artificial Disc implants are provided STERILE. Re-sterilization of the implants is not recommended. The polyethylene components may not be re-sterilized for any reason. No implant should be re-used once it comes into contact with human tissue or body fluid.

Sterile SECURE®-C implants are sterilized by gamma radiation using a standard medical device sterilization dose of 25-40kGy. This dose was validated using the VD_{MAX} method according to ANSI/AAMI/ISO 11137-2:2006 Sterilization of Healthcare Products. Sterilization validation was performed to assure a Sterility Assurance Level (SAL) of 10^{-6}. Sterile implants are packaged in a heat sealed, double foil pouch. The expiration date is provided on the package label. Do not use if expired. These implants are considered sterile unless the packaging has been opened or damaged. Carefully inspect each component and its packaging for any damage. Do not use if the packaging or the implant is damaged.

All instruments used in surgery must be sterilized by the hospital prior to use. Remove all packaging materials prior to sterilization. Prior to sterilization, confirm that all instruments that can be disassembled remain disassembled and any handles remain detached, as described above in the CLEANING section. (Instruments may be reassembled following sterilization.) Only sterile products should be placed in the operative field.

The Cervical Instruments used with the SECURE®-C Cervical Artificial Disc are provided non-sterile, and have been validated following ANSI/AAMI/ISO 17665-1:2006 Guidelines for Steam Sterility Validation to assure a Sterility Assurance Level (SAL) of 10^{-6}. The use of an FDA cleared wrap is recommended, per the Association for the Advancement of Medical Instrumentation (AAMI) ST79, *Comprehensive Guide to Steam Sterilization and Sterility Assurance in Health Care Facilities.*

The Cervical Instruments used with the SECURE®-C Cervical Artificial Disc are supplied NONSTERILE. Sterilization is recommended as follows:

Method	Cycle	Temperature	Exposure Time	Drying Time
Steam	Pre-vacuum (wrapped)	132° C (270° F)	4 minutes	30 minutes
Steam	Gravity displacement (wrapped)	132° C (270° F)	15 minutes	45 minutes

Always immediately clean and re-sterilize instruments that have been used in surgery. This process must be performed before handling or (if applicable) returning to Globus Medical.

These parameters are validated to sterilize these instruments. The autoclave must be properly installed, maintained, and calibrated.

CONFORMANCE TO STANDARDS

The SECURE®-C endplates are manufactured from cobalt-chrome-molybdenum alloy, CoCrMo, as specified in ASTM F1537 (and ISO 5832-12). The superior and inferior surfaces of the SECURE®-C endplates are plasma sprayed with commercially pure titanium, as specified in ASTM F1580, F1978, F1147 and C-633 (and ISO 5832-2). The SECURE®-C cores are manufactured from ultra-high molecular weight polyethylene, UHMWPE, as specified in ASTM F648 (and ISO 5834-2).

CONTACT INFORMATION

Globus Medical may be contacted at 1-866-GLOBUS1 (456-2871) or at www.globusmedical.com. A complete Summary of Safety and Effectiveness (SSED), surgical technique, and labeling information for SECURE®-C may be obtained at www.fda.gov by searching PMA number P100003.

PRODUCT COMPLAINTS

Any health care professional (e.g., customer or user of this system), who has any complaints or who has experienced any dissatisfaction in the product quality, identity, durability, reliability, safety, effectiveness and/or performance, should notify Globus Medical. Further, if any of the implanted system component(s) ever "malfunctions," (i.e., does not meet any of its performance specifications or otherwise does not perform as intended), or may have caused or contributed to the death or serious injury of a patient, Globus Medical should be notified immediately by telephone, fax or written correspondence. When filing a complaint, please provide the component(s) name and number, lot number(s), your name and address, and the nature of the complaint. Complaints may also be reported directly to Medwatch at http://www.fda.gov/medwatch. You will be contacted by Globus Medical to provide specific information for an Enhanced Surveillance Study, for specific information regarding your clinical experience regarding the complaint and overall experience with the device. In the event that the SECURE®-C device requires removal for any reason, follow the instructions provided below in the DEVICE RETRIEVAL section.

DEVICE RETRIEVAL

Should it be necessary to explant a SECURE®-C Cervical Artificial Disc device, please contact Globus Medical to receive instructions regarding data collection, including histopathological, mechanical, patient and adverse event information. Please refer to the SECURE®-C Cervical Artificial Disc Surgical Technique for step-by-step instructions on the required surgical technique for device retrieval. All explanted devices must be returned to Globus Medical for analysis, in a leakproof container, with the date of explantation, explanting surgeon, and any known information regarding initial implantation, reasons for removal, and adverse event information. Please note that the explanted SECURE®-C device should be removed as carefully as possible in order to keep the implant and surrounding tissue intact. Also, please provide descriptive information about the gross appearance of the device in situ, as well as descriptions of the removal methods, i.e., intact or in pieces. Globus Medical will request additional information regarding the reason for removal, patient information and associated clinical outcomes.

NOTE: All implant removals must be reported immediately to Globus Medical.

Limited warranty and disclaimer: Globus Medical products are sold with a limited warranty to the original purchaser against defects in workmanship and materials. Any other express or implied warranties, including warranties of merchantability or fitness, are hereby disclaimed.

CAUTION: Federal (U.S.A) Law Restricts this Device to Sale by or on the order of a Physician.
